Project Design Phase
Solution Architecture

Date	30 September 2026
Team ID	9100TeamTrio
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	4 Marks

Solution Architecture:

Solution architecture is a complex process – with many sub-processes – that bridges the gap between business problems and technology solutions. Its goals are to:

- Find the best tech solution to solve existing business problems.
- Describe the structure, characteristics, behavior, and other aspects of the software to project stakeholders.
- Define features, development phases, and solution requirements.
- Provide specifications according to which the solution is defined, managed, and delivered.

Solution Architecture Diagram – Auto Ticket Classification using Flow Designer:

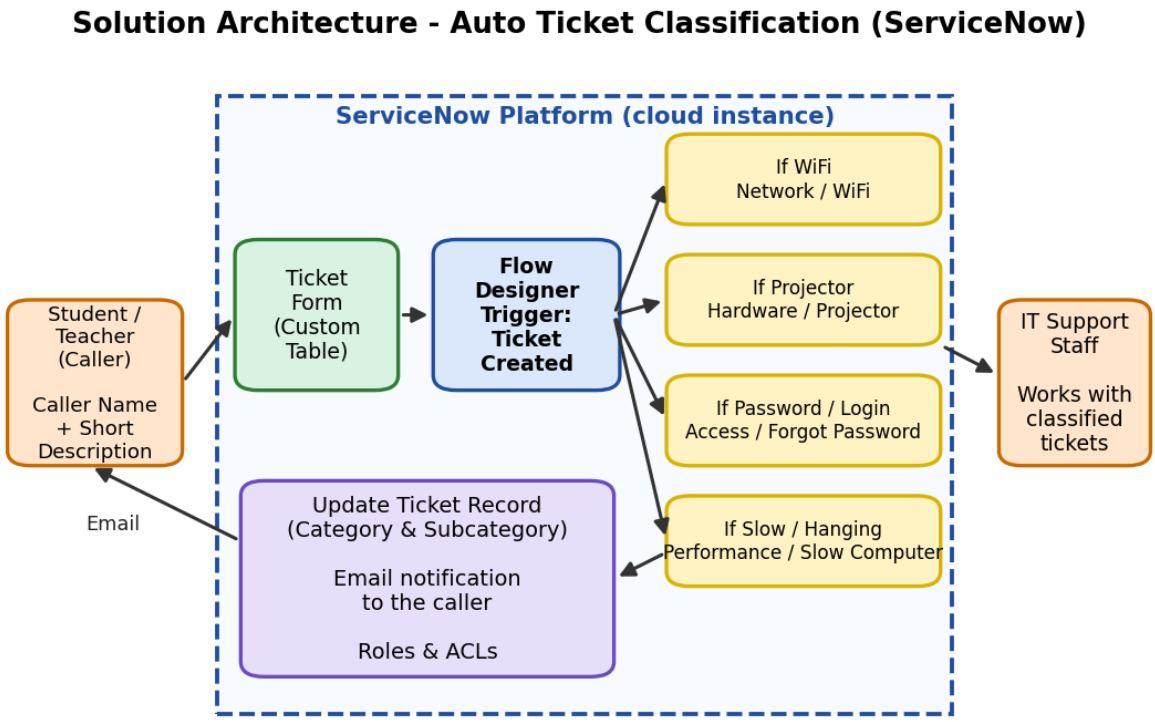

Figure 1: Architecture and data flow of the Auto Ticket Classification solution

Architecture flow: (1) The student or teacher creates a ticket and enters only the Caller Name and Short Description. (2) The ticket is stored in the custom table, which triggers the Flow Designer flow. (3) The flow evaluates the Short Description for the keywords WiFi, Projector, Password / Login and Slow / Hanging. (4) Based on the matched keyword the flow updates the Category and Subcategory of the ticket and informs the caller by email. (5) Roles and ACLs ensure that only authorized users can access or modify the ticket data, and IT staff work with tickets that are already classified.
